Data Loading

Dataset yang digunakan pada proyek ini adalah **Animals-10 Dataset** yang diperoleh dari platform Kaggle: https://www.kaggle.com/datasets/antobenedetti/animals

Dataset dimuat dari Google Drive dan berhasil diekstrak ke direktori kerja. Berdasarkan eksplorasi awal, diperoleh informasi sebagai berikut:

- Total jumlah gambar: **26.179**
- Jumlah kelas: **10**
- Nama kelas:
  - *pecora, gatto, cavallo, gallina, mucca, elefante, ragno, scoiattolo, cane, farfalla*

Distribusi jumlah gambar pada tiap kelas bervariasi, dengan jumlah terbanyak pada kelas *cane* dan *ragno*, serta paling sedikit pada kelas *elefante*.

Selain itu, dataset memiliki **variasi resolusi gambar yang tinggi** (terdapat 162 variasi ukuran), yang menunjukkan bahwa data tidak seragam. Oleh karena itu, diperlukan tahap preprocessing seperti resizing agar seluruh gambar memiliki dimensi yang konsisten sebelum digunakan dalam proses training model.

Data Preprocessing

Pada tahap ini, dataset dibagi menjadi tiga bagian utama, yaitu data latih (train), data validasi (validation), dan data uji (test). Pembagian ini bertujuan untuk memastikan model dapat dilatih dengan baik serta dievaluasi secara objektif terhadap data yang belum pernah dilihat sebelumnya.

Hasil pembagian dataset adalah sebagai berikut:

- Data latih (train): **18.322 gambar**
- Data validasi (validation): **3.926 gambar**
- Data uji (test): **3.931 gambar**

Total data tetap konsisten dan seluruh kelas terdistribusi ke dalam masing-masing subset.

Selanjutnya, dilakukan proses preprocessing menggunakan `ImageDataGenerator`, yang mencakup:

- Normalisasi pixel (rescale 1./255)
- Data augmentation pada data latih seperti rotasi, zoom, dan horizontal flip

Perlu diperhatikan bahwa **data augmentation hanya diterapkan pada data latih**, sedangkan data validasi dan data uji hanya dilakukan normalisasi. Hal ini bertujuan agar evaluasi model tetap merepresentasikan performa pada data asli.

Setelah preprocessing, dataset berhasil dimuat ke dalam generator dengan jumlah sebagai berikut:

- Train: 18.322 gambar (10 kelas)
- Validation: 3.926 gambar (10 kelas)
- Test: 3.931 gambar (10 kelas)

Adapun kelas yang digunakan dalam proses klasifikasi adalah: *cane, cavallo, elefante, farfalla, gallina, gatto, mucca, pecora, ragno, scoiattolo*

Modelling

Pada tahap ini, model klasifikasi gambar dikembangkan menggunakan pendekatan **Deep Learning (CNN)** dengan memanfaatkan **transfer learning**.

Model yang digunakan adalah **MobileNetV2** sebagai dasar, kemudian ditambahkan beberapa layer fully connected untuk menyesuaikan dengan jumlah kelas pada dataset.

Proses training dilakukan dalam dua tahap:

1. Pelatihan awal dengan sebagian besar layer dibekukan *(freeze)*
2. Fine-tuning dengan membuka beberapa layer untuk meningkatkan performa

Hasil training menunjukkan performa yang sangat baik:

- Akurasi training mencapai lebih dari **97%**
- Akurasi validasi berada di kisaran **96%–97%**

Berdasarkan grafik akurasi dan loss, model mampu belajar dengan baik tanpa indikasi overfitting yang signifikan.

y_pred = model.predict(test_generator)
y_pred_classes = np.argmax(y_pred, axis=1)

y_true = test_generator.classes

# === CLASSIFICATION REPORT ===

Evaluasi dan Visualisasi

Model dievaluasi menggunakan data uji (test set) yang tidak pernah dilihat sebelumnya. Hasil evaluasi menunjukkan performa yang sangat baik dengan akurasi mencapai sekitar **96.8%**.

Berdasarkan classification report, hampir seluruh kelas memiliki nilai precision, recall, dan f1-score yang tinggi (mendekati 1.00), yang menunjukkan bahwa model mampu melakukan klasifikasi dengan sangat baik pada berbagai kategori.

Confusion matrix juga menunjukkan bahwa sebagian besar prediksi berada pada diagonal utama, yang berarti model mampu mengklasifikasikan gambar dengan benar. Kesalahan prediksi yang terjadi relatif kecil dan tersebar di beberapa kelas tertentu seperti *mucca* dan *pecora*, namun tidak signifikan.

Secara keseluruhan, model memiliki performa yang stabil dan mampu melakukan generalisasi dengan baik terhadap data baru.

Konversi Model

Setelah model selesai dilatih, dilakukan proses konversi model ke beberapa format agar dapat digunakan di berbagai platform.

Model berhasil dikonversi ke tiga format utama, yaitu:

- **SavedModel** → digunakan untuk deployment berbasis TensorFlow

- **TensorFlow Lite (TFLite)** → digunakan untuk perangkat mobile dan embedded system
- **TensorFlow.js (TFJS)** → digunakan untuk aplikasi berbasis web

Selain itu, file label juga disimpan untuk memetakan hasil prediksi ke nama kelas.

Seluruh proses konversi berhasil dilakukan tanpa kendala, dan struktur folder submission telah disusun sesuai dengan ketentuan yang diberikan.

import matplotlib.pyplot as plt

img_path = test_generator.filepaths[0]

# Load image

img_array = image.img_to_array(img) / 255.0
img_array = np.expand_dims(img_array, axis=0)

# Predict
prediction = model.predict(img_array)
predicted_class = class_names[np.argmax(prediction)]

Inference

Model yang telah dilatih kemudian digunakan untuk melakukan prediksi terhadap beberapa gambar dari data uji (test set).

Hasil inference menunjukkan bahwa model mampu mengklasifikasikan gambar dengan sangat baik. Pada contoh yang ditampilkan, seluruh gambar berhasil diprediksi sebagai kelas *cane* dengan tingkat kepercayaan (confidence) yang sangat tinggi, bahkan mendekati 1.00.

Hal ini menunjukkan bahwa model tidak hanya memiliki akurasi yang tinggi secara numerik, tetapi juga mampu memberikan prediksi yang konsisten pada data baru yang belum pernah dilihat sebelumnya.

Dengan demikian, model dapat dikatakan memiliki kemampuan generalisasi yang baik dan siap digunakan untuk kasus klasifikasi gambar serupa.
